Software Developer Interview – Exercise # 2

Thanks for applying for a Developer position at EnverSoft!

Please complete the coding exercise described below. The task itself will be very simple to implement, but we would like to see how you would approach the problem as well as how you unit test your code. Feel free to use the libraries that you are most comfortable with, but please write the code in C#. When you have completed the task, please upload it to the public source repository (GitHub, Bitbucket, Gitlab etc.)

Provide us with a program that reads a CSV file and outputs two text files.

Given the following:

FirstName	LastName	Address	PhoneNumber
Jimmy	Smith	102 Long Lane	29384857
Clive	Owen	65 Ambling Way	31214788
James	Brown	82 Stewart St	32114566
Graham	Howe	12 Howard St	8766556
John	Howe	78 Short Lane	29384857
Clive	Smith	49 Sutherland St	31214788
James	Owen	8 Crimson Rd	32114566
Graham	Brown	94 Roland St	8766556

The first should show the frequency of both the first and last names ordered by frequency first (descending) and then alphabetically (ascending).
E.g.
Brown,2
Clive,2
Graham,2
Howe,2
James,2
Owen,2
Smith,2
Jimmy,1
John,1

The second should show the addresses sorted alphabetically by street name.
E.g.
65 Ambling Way
8 Crimson Rd
12 Howard St
102 Long Lane

94 Roland St
78 Short Lane
82 Stewart St
49 Sutherland St

So ordered by frequency first (descending) and then alphabetically (ascending).

As mentioned can you also include a unit test project using whichever unit-testing framework you are most comfortable with…
